

# CS4001 – Trust, Risk, & Security

By: Keith Watson  
CoC Information Security Manager

# What we will be talking about today

- Trust, risk and security.
- How do you measure trust
- Choose a side
- An example of the epic failure of trust -  
session hijacking, Firesheep demonstration
- Stop being a victim, protect yourself
- Is it ethical or even legal
- Where to get additional information

# What is trust?

- Trust – Your belief in the positive actions of a person, entity, process, or device (especially when no one is watching)
- Trust doesn't guarantee results it only predicts a **positive** outcome
- Society is built on a fabric of trust (or perceived trust)

# What is risk?

- Risk - the potential that trust will lead to a negative outcome
- Risk does not guarantee failure but only predicts a **negative** outcome
- Risk = (probability of failure) x (harm)
- Risk mitigation is a contingency plan for failed trust

# What is security?

- Security – actions taken to protect against risk and violation of trust
- Perfect security does not exits
- Security doesn't happen by itself
- Security takes no effort to get wrong and takes hard work to get right

# How do you measure trust and risk?

- People have a natural predilection to trust
- We make trust and risk decisions based on emotion and not reason (peer pressure, oxytocin)
- We are vulnerable to anyone willing to violate trust
- Willingness to violate trust = (perceived reward) / (probability of being caught x possible consequences)

# What will you do?

- Will you uphold trust or destroy it?
- Protect yourself (security)
  - Detect
  - Monitor
  - Respond
- Be trustworthy to others
- Require your friends to be trust worthy
- Require vendors to be trust worthy (vote with your wallet)

# An example of the epic failure of trust

- Vendors have improperly handled web site session management
- The public (that's you) has done virtually nothing to protect them selves or hold vendors accountable
- Result - Bad guys are compromising your data with impunity and the only one paying the price is you

# It all starts with state. What is it?

- A stateless protocol is one that treats each transaction as unrelated to previous transactions
- HTTP by design is a stateless protocol

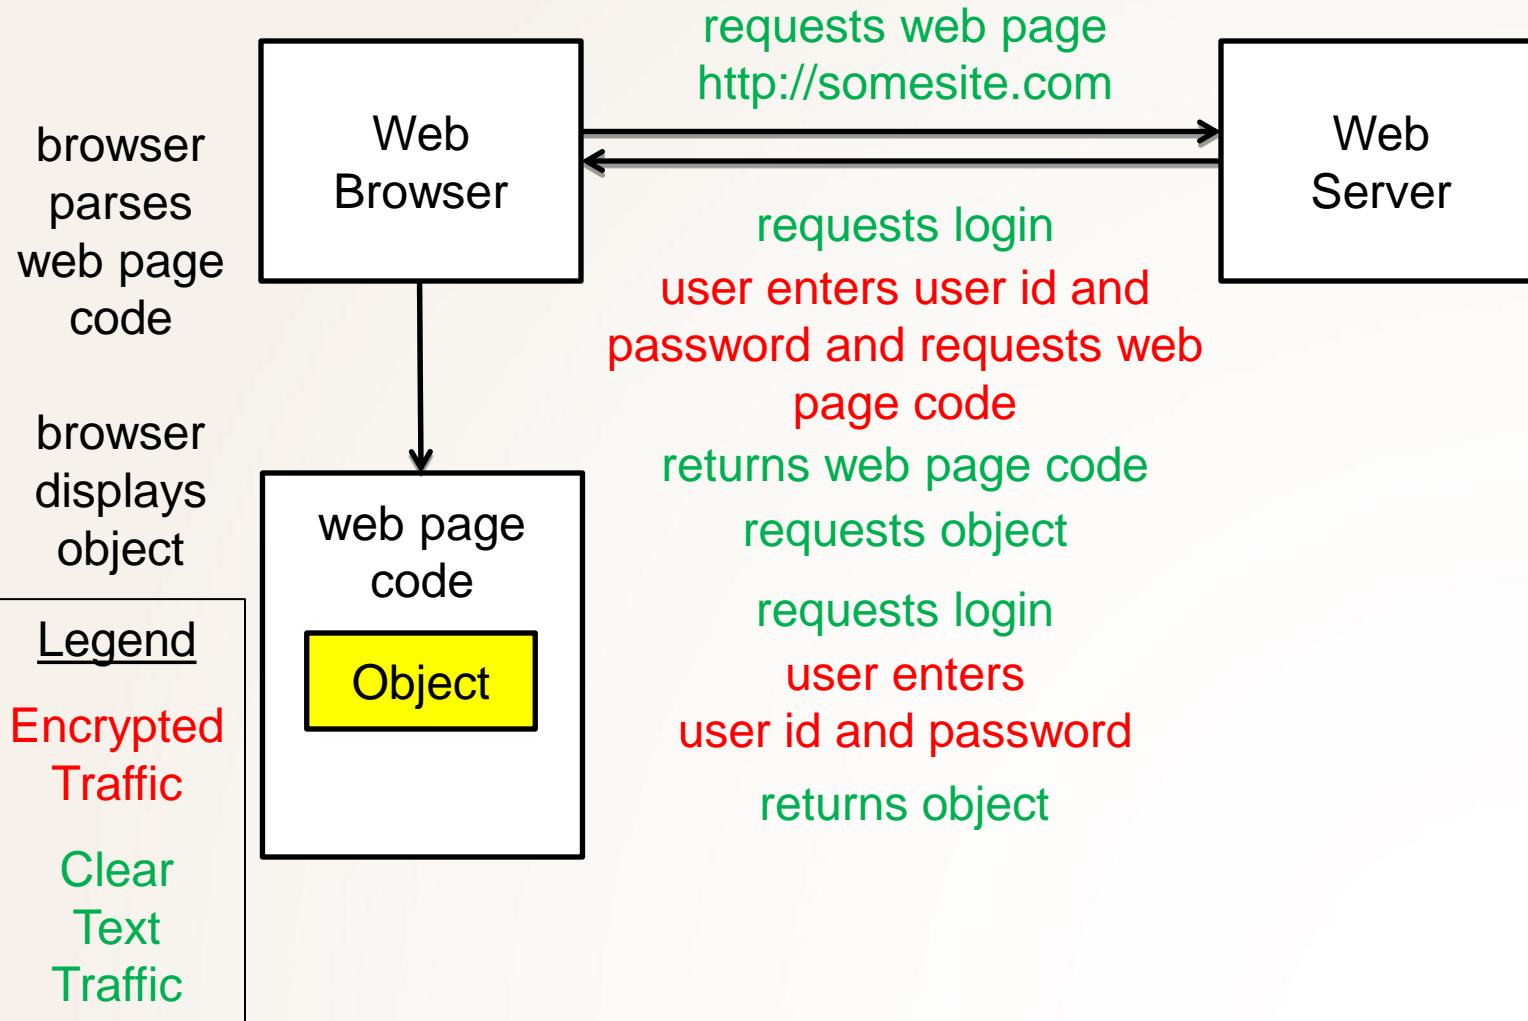

# Why HTTP based services need state (session management)

- Any service that ties to a user's identity needs to have state
  - Online banking
  - Web shopping
  - Social networking
  - Webmail
- Otherwise there is no way to associate each transaction with the user

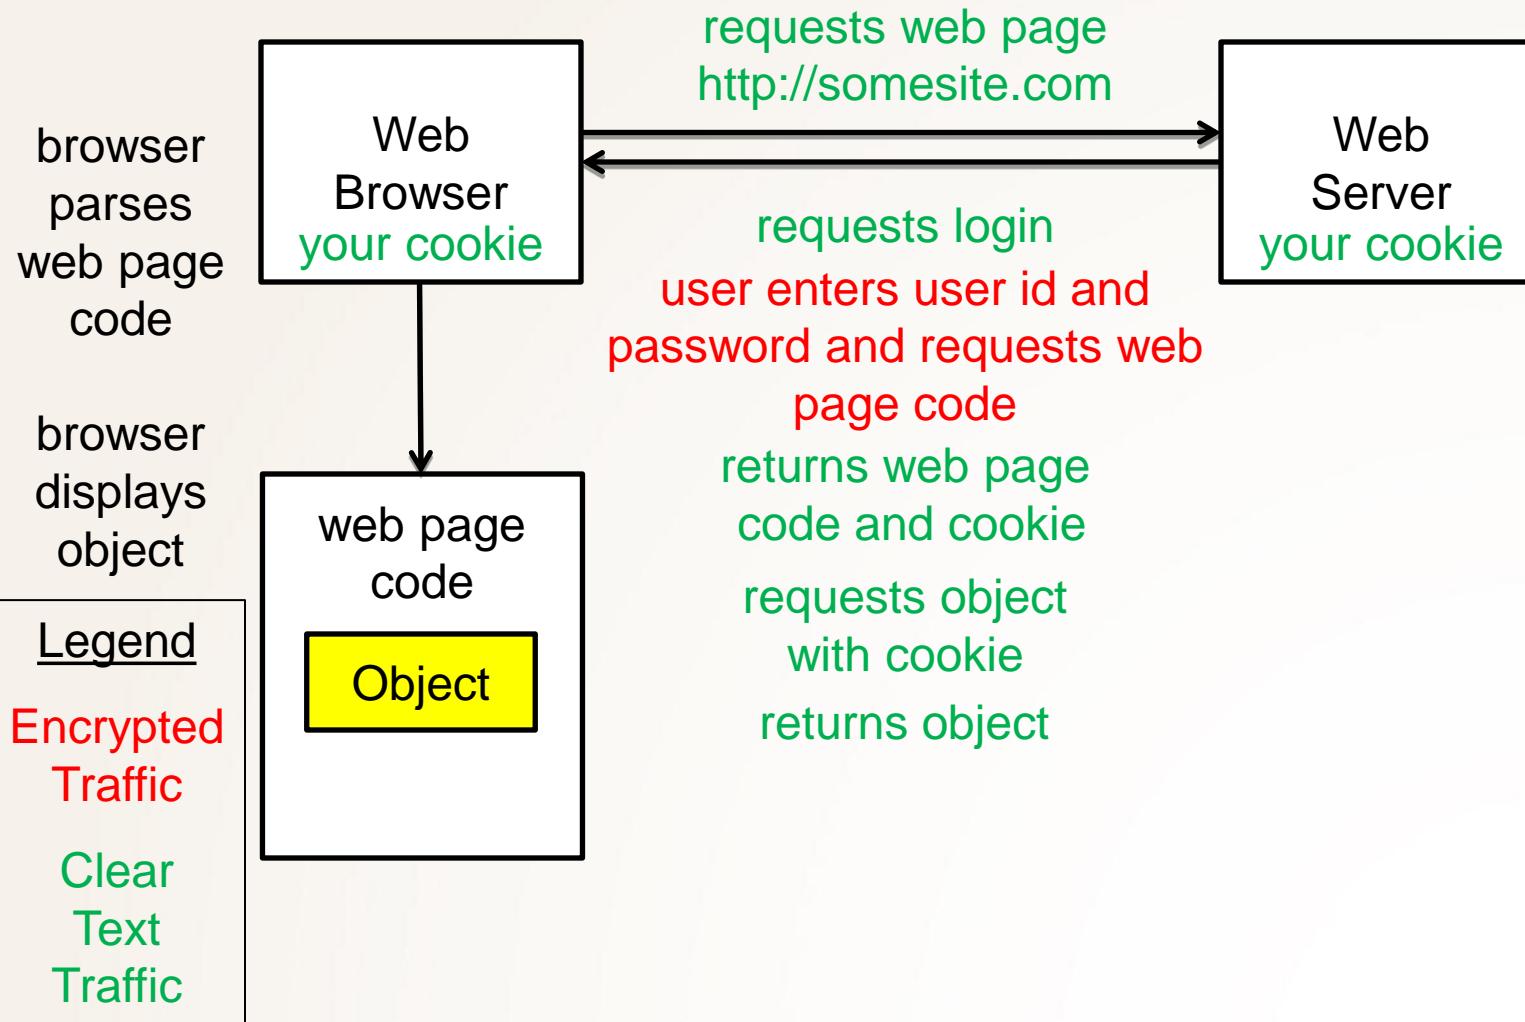

# Example of HTTP service **without** state

# Example of HTTP service **with state**

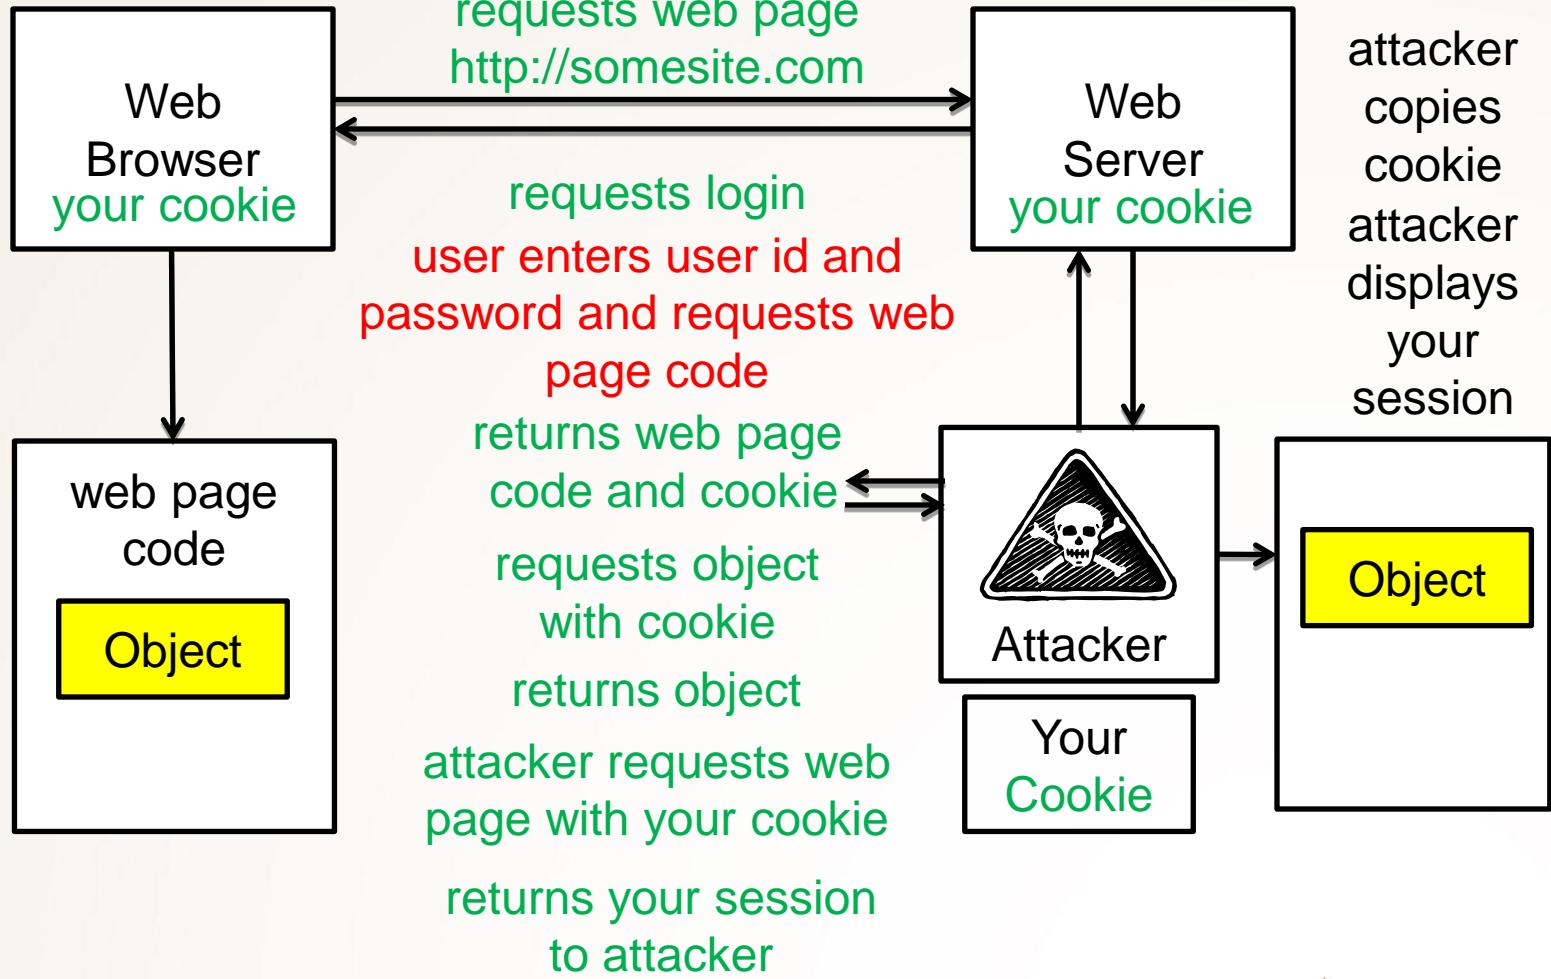

# How session hijacking works

browser  
parses  
web page  
code

browser  
displays  
object

## Legend

Encrypted  
Traffic  
Clear  
Text  
Traffic

# Saving state with cookies – It's not new

- Cookies were the first method of saving state
  - Invented by Lou Montulli in 1994 while working for Netscape
  - Internet Explorer began supporting cookies in 1995
  - In 1996 the IETF recognized cookies as a significant privacy and security threat
  - Jan 2003 – Session Management added to OWASP Top 10

# Session hijacking (sidejacking) tools

- [CookieMonster](#)
- [Edit Cookies](#)
- [FBConTroller](#)
- [Hamster & Ferret](#)
- [py-cookieJsInjection](#)
- [FaceNiff \(Android\)](#)
- [DroidSheep \(Android, includes ARP Spoof\)](#)
- [Firesheep](#)

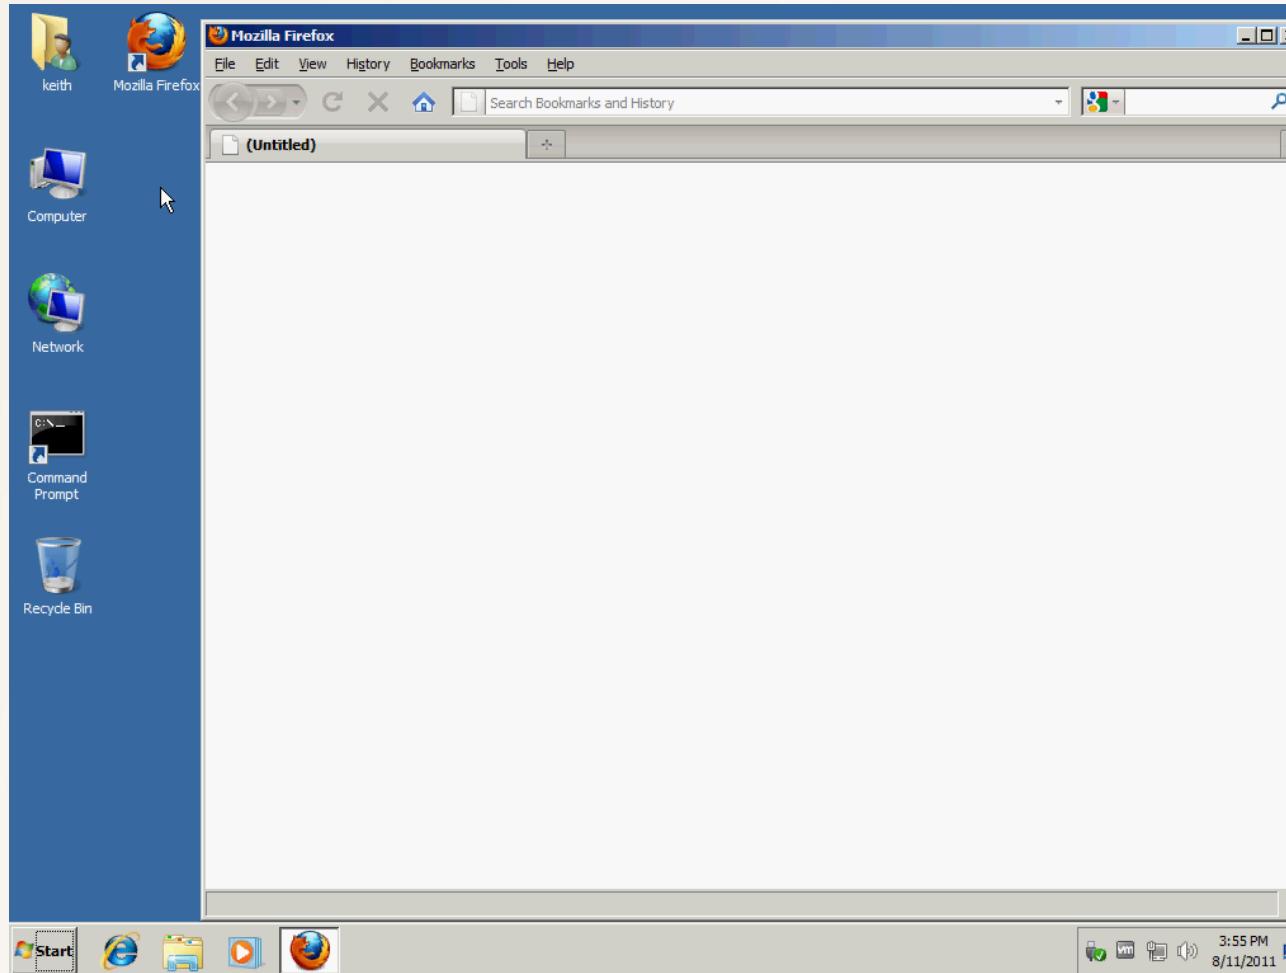

# Why is it suddenly a big deal

- The tools for session hijacking were difficult to install and use
- Most service providers ignored the problem
- Firesheep released at Toorcon, Oct. 2010  
(a tool my grandmother could install and use)
- Mass media feeding frenzy (the perfect storm)
- Service providers finally took “some” action

# How easy is it to install Firesheep?

# Firesheep demonstration

# How to protect yourself

- Use fully qualified HTTPS URLs
  - you will be susceptible to a man in the middle attack if you use browser auto-complete or browse to the HTTP version of the site first
- If you connect to an HTTP site while using an HTTPS site you are susceptible to Surf Jacking
  - use NoScript or HTTPS Everywhere to force secure cookies

# How to protect yourself contd.

- Configure your profile to always use HTTPS
  - Facebook
    - Enable Browse Facebook on a secure connection (https) when possible
  - Gmail
    - Always use https

# How to protect yourself contd.

- Configure your profile to always use HTTPS
  - Twitter – login and session are https (http no longer an option)
  - Linkedin
    - [When possible, use a secure connection \(https\) to browse LinkedIn](#)

# How to protect yourself contd.

- Force HTTPS with a plugin
  - [HTTPS Everywhere](#) ([Firefox](#) Add-On)
  - [Force-TLS](#) ([Firefox](#) Add-On)
  - [ForceHTTPS](#) ([Firefox](#) Add-On)
  - [NoScript](#) ([Firefox](#) Add-On)
  - [Use HTTPS](#) ([Chrome](#) Plugin)
  - [Fidelio](#) ([Chrome](#) Plugin)

# How to protect yourself contd.

- Use a VPN (Virtual Private Network)
- Use an encrypted anonymizer or proxy (there are caveats)
  - TOR (The Onion Routing project)
    - Want Tor to really work?
  - JonDonym
  - JAP (JonDonym Anonymous Proxy)
  - I2P

# Demand vendors protect you

- Configure their web site to be secure
  - Use [HTTPS](#)
  - Set the [cookie secure flag](#)
  - Use [One Time Cookies](#)
  - [Slaying Firesheep](#) (cookie management)
  - OWASP Top 10 2010-[A3-Broken Authentication and Session Management](#)
  - OWASP Top 10 2010-[A9-Insufficient Transport Layer Protection](#)

# Is it ethical to create a hacking tools?

- What are the ethics related to releasing a tool like Firesheep?
  - Full disclosure –vs- responsible disclosure

# Is it legal to use a tool like this?

- Georgia Tech policies that are potentially broken by using Firesheep
  - [Computer & Network Usage and Security Policy \(CNUSP\)](#)
  - [Georgia Tech Academic Honor Code](#)
  - [Board of Regents Policy](#)

# Is it legal to use a tool like this contd?

- State of Georgia laws that are potentially broken by using Firesheep
  - [Georgia Computer Systems Protection Act](#)
- U.S. Federal laws that are potentially broken by using Firesheep
  - [Computer Fraud and Abuse Act](#)
  - [Electronic Communications Privacy Act](#)
